KAIST

Class Objectives

- **Understand a basic structure of Monte Carlo ray tracing**
 - **Russian roulette for its termination**
 - **Stratified sampling**
- **Quasi-Monte Carlo ray tracing**

Why Monte Carlo?

- Radiance is hard to evaluate

$$\underline{L(x \rightarrow \Theta)} = \underline{L_e(x \rightarrow \Theta)} + \int_{\Omega_x} \underline{f_r(\Psi \leftrightarrow \Theta)} \cdot \underline{L(x \leftarrow \Psi)} \cdot \cos(\Psi, n_x) \cdot d\omega_\Psi$$

From kavita's slides

- Sample many paths
 - Integrate over all incoming directions
- Analytical integration is difficult
 - Need numerical techniques

Rendering Equation

$$L(x \rightarrow \Theta) = L_e(x \rightarrow \Theta) + \int_{\Omega_x} \underbrace{f_r(\Psi \leftrightarrow \Theta) \cdot L(x \leftarrow \Psi)}_{\text{function to integrate over all incoming directions over the hemisphere around x}} \cdot \cos(\Psi, n_x) \cdot d\omega_\Psi$$

Value we want

$$= L_e + \int_{\Omega_x} \text{[Hemisphere Image]} \cdot f_r \cdot \cos$$

How to compute?

$$L(x \rightarrow \Theta) = ?$$

Check for $L_e(x \rightarrow \Theta)$

Now add $L_r(x \rightarrow \Theta) =$

$$\int_{\Omega_x} f_r(\Psi \leftrightarrow \Theta) \cdot L(x \leftarrow \Psi) \cdot \cos(\Psi, n_x) \cdot d\omega_\Psi$$

How to compute?

- Use Monte Carlo
- Generate random directions on hemisphere Ω_x using pdf $p(\Psi)$

$$L(x \rightarrow \Theta) = \int_{\Omega_x} f_r(\Psi \leftrightarrow \Theta) \cdot L(x \leftarrow \Psi) \cdot \cos(\Psi, n_x) \cdot d\omega_\Psi$$

$$\langle L(x \rightarrow \Theta) \rangle = \frac{1}{N} \sum_{i=1}^N \frac{f_r(\Psi_i \leftrightarrow \Theta) \cdot L(x \leftarrow \Psi_i) \cdot \cos(\Psi_i, n_x)}{p(\Psi_i)}$$

How to compute?

Generate random directions Ψ_i

$$\langle L \rangle = \frac{1}{N} \sum_{i=1}^N \frac{f_r(\dots) \cdot L(x \leftarrow \Psi_i) \cdot \cos(\dots)}{p(\Psi_i)}$$

- evaluate brdf
- evaluate cosine term
- evaluate $L(x \leftarrow \Psi_i)$

How to compute?

- evaluate $L(x \leftarrow \Psi_i)$?
- Radiance is invariant along straight paths
- $vp(x, \Psi_i) =$ first visible point
- $L(x \leftarrow \Psi_i) = L(vp(x, \Psi_i) \rightarrow \Psi_i)$

How to compute? Recursion ...

- Recursion
- Each additional bounce adds one more level of indirect light
- Handles ALL light transport
- “Stochastic Ray Tracing”

When to end recursion?

From kavita's slides

- **Contributions of further light bounces become less significant**
 - Max recursion
 - Some threshold for radiance value
- **If we just ignore them, estimators will be biased**

Russian Roulette

Integral

$$I = \int_0^1 f(x) dx = \int_0^1 \frac{f(x)}{P} P dx = \int_0^P \frac{f(y/P)}{P} dy$$

Estimator

$$\langle I_{\text{roulette}} \rangle = \begin{cases} \frac{f(x_i)}{P} & \text{if } x_i \leq P, \\ 0 & \text{if } x_i > P. \end{cases}$$

Variance

$$\sigma_{\text{roulette}} > \sigma$$

Russian Roulette

- **Pick absorption probability, $\alpha = 1-P$**
 - Recursion is terminated
- **$1 - \alpha = P$ is commonly to be equal to the reflectance of the material of the surface**
 - Darker surface absorbs more paths

Algorithm so far

- **Shoot primary rays through each pixel**
- **Shoot indirect rays, sampled over hemisphere**
- **Terminate recursion using Russian Roulette**

Pixel Anti-Aliasing

- **Compute radiance only at the center of pixel**
 - Produce jaggies
- **Simple box filter**
 - The averaging method
- **We want to evaluate using MC**

Stochastic Ray Tracing

- **Parameters**
 - **Num. of starting ray per pixel**
 - **Num. of random rays for each surface point (branching factor)**
- **Path tracing**
 - **Branching factor = 1**

Path Tracing

1 ray / pixel

10 rays / pixel

100 rays / pixel

From kavita's slides

- **Pixel sampling + light source sampling folded into one method**

Algorithm so far

- Shoot primary rays through each pixel
- Shoot indirect rays, sampled over hemisphere
 - Path tracing shoots only 1 indirect ray
- Terminate recursion using Russian Roulette

Algorithm

Performance

- **Want better quality with smaller # of samples**
 - **Fewer samples/better performance**
 - **Stratified sampling**
 - **Quasi Monte Carlo: well-distributed samples**
- **Faster convergence**
 - **Importance sampling**

PA2

**Uniform sampling
(64 samples per pixel)**

Adaptive sampling

Reference

Stratified Sampling

- Samples could be arbitrarily close
- Split integral in subparts

$$I = \int_{x_1} f(x) dx + \dots + \int_{x_N} f(x) dx$$

- Estimator

$$\bar{I}_{strat} = \frac{1}{N} \sum_{i=1}^N \frac{f(\bar{x}_i)}{p(\bar{x}_i)}$$

- Variance: $\sigma_{strat} \leq \sigma_{sec}$

Stratified Sampling

9 shadow rays
not stratified

9 shadow rays
stratified

Stratified Sampling

36 shadow rays
not stratified

36 shadow rays
stratified

High Dimensions

→ N^2 samples

- **Problem for higher dimensions**
- **Sample points can still be arbitrarily close to each other**

Higher Dimensions

- **Stratified grid sampling**

→ N^d samples

- **N-rooks sampling**

→ N samples

N-Rooks Sampling - 9 rays

Quasi Monte Carlo

- Eliminates randomness to find well-distributed samples
- Samples are deterministic but “appear” random

Quasi-Monte Carlo (QMC)

- Notions of variance, expected value don't apply
- Introduce the notion of discrepancy
 - Discrepancy mimics variance
 - E.g., subset of unit interval $[0,x]$
 - Of N samples, n are in subset
 - Discrepancy: $|x-n/N|$
 - Mainly: “it looks random”

Example: van der Corput Sequence

- One of simplest low-discrepancy sequences
- Radical inverse function, $\Phi_b(n)$
 - Given $n = \sum_{i=1}^{\infty} d_i b^{i-1}$,
 - $\Phi_b(n) = 0.d_1 d_2 d_3 \dots d_n$
 - E.g., $\Phi_2(i): 111010_2 \rightarrow 0.010111$
- van der Corput sequence, $x_i = \Phi_2(i)$

Example: van der Corput Sequence

- One of simplest low-discrepancy sequences
- $x_i = \Phi_2(i)$

i	Base 2	$\Phi_2(i)$
1	1	.1 = 1/2
2	10	.01 = 1/4
3	11	.11 = 3/4
4	100	.001 = 1/8
5	101	.101 = 5/8
.	.	.
.	.	.
.	.	.

Halton and Hammersley

- **Halton**

- $x_i = (\Phi_2(i), \Phi_3(i), \Phi_5(i), \dots, \Phi_{\text{prime}}(i))$

- **Hammersley**

- $x_i = (1/N, \Phi_2(i), \Phi_3(i), \Phi_5(i), \dots, \Phi_{\text{prime}}(i))$

- **Assume we know the number of samples, N**

- **Has slightly lower discrepancy**

Halton

Hammersley

Why Use Quasi Monte Carlo?

- **No randomness**
- **Much better than pure Monte Carlo method**
- **Converge as fast as stratified sampling**

Performance and Error

- **Want better quality with smaller number of samples**
 - **Fewer samples → better performance**
 - **Stratified sampling**
 - **Quasi Monte Carlo: well-distributed samples**
- **Faster convergence**
 - **Importance sampling: next-event estimation**

Class Objectives were:

- **Understand a basic structure of Monte Carlo ray tracing**
 - **Russian roulette for its termination**
 - **Stratified sampling**
- **Quasi-Monte Carlo ray tracing**

Homework

- **Go over the next lecture slides before the class**
- **Watch 2 SIGGRAPH videos and submit your summaries every Tue. class**
 - **Just one paragraph for each summary**

Example:

Title: XXX XXXX XXXX

Abstract: this video is about accelerating the performance of ray tracing. To achieve its goal, they design a new technique for reordering rays, since by doing so, they can improve the ray coherence and thus improve the overall performance.

Any Questions?

- **Come up with one question on what we have discussed in the class and submit at the end of the class**
 - **1 for already answered questions**
 - **2 for typical questions**
 - **3 for questions with thoughts**
- **Submit questions at least four times before the mid-term exam**
 - **Multiple questions for the class is counted as only a single time**

Next Time

- **Importance sampling for MC ray tracing**
